1.3. Event Interface	1

Chapter 1. Notification Domain

The notification domain is an abstraction for basic notification services, like for example email notification.

1.1. Description

The notification domain provides the functionality for sending notifications to a specific recipient.

1.2. Functional Interface

The following listing presents the Java Domain Interface. This interface also contains information about events raised by this domain.

```
public interface NotificationDomain extends Domain {  
  
    void notify(Notification notification);  
  
}
```

1.3. Event Interface

The following interface presents the events an appointment connector can throw:

```
public interface NotificationDomainEvents extends DomainEvents {  
  
}
```
